■ Step-by-Step Guide: Uploading an Image to Docker Hub

This guide walks you through how to push your locally built Docker image to Docker Hub so it can be accessed and used anywhere.

1■■ Step 1: Create a Docker Hub Account

If you don't already have an account, visit https://hub.docker.com/ and sign up. Your username will be used in your image name on Docker Hub.

2■■ Step 2: Log In to Docker Hub

Use the following command to log in to your Docker Hub account from your terminal:

```
docker login
```

When prompted, enter your Docker Hub username and password or token. You should see:

```
Login Succeeded
```

3■■ Step 3: Tag Your Local Image for Docker Hub

You need to tag your image with your Docker Hub username and repository name.
Syntax:

```
docker tag : /:
```

Example:

```
docker tag registration:1.0 john123/registration:1.0
```

4■■ Step 4: Push the Image to Docker Hub

Now upload your image to Docker Hub using:

```
docker push john123/registration:1.0
```

Docker will upload all necessary layers and confirm once completed.

5■■ Step 5: Verify on Docker Hub

Go to https://hub.docker.com/repositories and you should see your new repository named john123/registration with the tag 1.0 listed.

6■■ Step 6: Pull and Run Your Image Anywhere

Anyone can now download and run your image using:

```
docker pull john123/registration:1.0
```

Then run it:

```
docker run -p 3000:3000 john123/registration:1.0
```

■ Quick Summary of Commands

docker login — Log in to Docker Hub

docker tag registration:1.0 /registration:1.0 — Tag your image for your repository
docker push /registration:1.0 — Push your image to Docker Hub
docker pull /registration:1.0 — Pull the image from Docker Hub
docker run -p 3000:3000 /registration:1.0 — Run the pulled image
